

Dental Laboratory Group

The Kameleon precision, flexible partial denture is the latest in Leixir technology.

- Color Adaptive – Kameleon has the ability to blend into the oral environment unlike heavy metal and acrylic partial dentures.
- More Comfortable – Kameleon is a lightweight, thin and semi-flexible polymer replacement for bulky metal appliances.
- Fits Better – Kameleon appliances flex when being placed in the mouth to provide ease of insertion and ideal adaptation.
- Excellent Retention – The transparent clasps flex and return to their original shape and will not lose their retention over time.
- Strong and Durable – Kameleon stands up to the stress of normal daily use, providing years of service.
- Relinable and Repairable – Can be relined in saddle areas and in some cases added to if patients remaining dentition changed.

Tips and Guidelines for Successful Handling, Placement, and Care of Kameleon Partials:

- Start with accurate void free impression; rest seats can be prepped for added support
- Centric Bite Registration
- Run Kameleon partial under warm water for 30 seconds prior to insertion for cases with severe undercuts for easy insertion
- Kameleon partials can also be sent for frame try-in with teeth in wax prior to process and delivery
- Contact the laboratory for case evaluation and compatibility if necessary

- In order to keep your Kameleon partial looking as good as new, it is important that you maintain good oral hygiene and take proper care of the appliance
- After meals, rinse appliance to remove food particles
- Clean your appliance daily using conventional (non-abrasive) toothpaste and water; if you soak appliance, only soak in water (no cleanser, soap, etc.)
- Only use a soft bristle brush and scrub gently to avoid damage
- Never use any abrasive cleaners to clean your appliance such as carbonated denture cleaners or powdered household cleaners
- Always handle your appliance with care
